

Pro Trading Desk Layout -- "Signal vs. Vehicle"

Workflow flows: ANALYZE -> DECIDE -> EXECUTE -> CONFIRM (left/top = study, right = act, bottom = confirm)

1) PRIMARY CHART -- SNDK • 30-min

+ Volume + RSI

THE SIGNAL -- the liquid underlying, where real price discovery happens. You WATCH this.

(overlay SNDQ here too, to see it track / decay)

2) SNDQ -- overlay on the chart, or a mini-chart

THE VEHICLE -- what you actually trade (2x inverse).

You don't stare at it for signal -- it's a noisy mirror of SNDK with worse liquidity. Just watch it TRACK.

--> This is the fix for your toggling: SNDK + SNDQ
BOTH always on screen, each in its right role.

3) QUOTE DETAILS -- SNDQ

consolidated bid/ask/last, IV, volume
(the price you actually trade against)

4) LEVEL 2 BOOK -- SNDQ

depth -- where size rests, slippage
(thin/wide on a leveraged ETF -- mind it)

5) ORDER ENTRY -- SNDQ

marketable LIMIT, not market

ACT right where you READ (no eye-travel:
quote + book + order stacked together)

6) ORDERS • PENDING • FILLS (+ day-trade counter)

Glanceable CONFIRMATION -- you should never wonder "did that fill?" Working orders, fills, and your PDT day-trades-remaining all visible without a click.

LINK ALL PANELS (same color group) -> one click on a symbol drives the WHOLE screen. | Real estate = importance (chart is biggest).

Analytics (GEX / options flow / vol regime) live in the BROWSER, not here -- keep the trading screen to only what you ACT on.
